USEFUL INFORMATION

about the HPV vaccination

Why do we need HPV vaccination?

Human Papillomavirus (HPV) vaccination (injection) is a primary prevention given to protect against diseases caused by some types of HPV.

HPV is a common virus that is mainly spread by contact during sexual activity. Most people who are sexually active would have been infected at some point in their lives. HPV often causes no symptoms for many years and this makes it hard to know when someone was first infected. It is easy to pass on the virus unwittingly when asymptomatic. In most healthy people, HPV goes away on its own and does not cause any health problems. But when HPV does not go away, it may cause illnesses such as warts and cancers. In Malaysia, about 1 in 10 healthy women would carry HPV and most will be unaware of it.

The HPV vaccine is known to help protect against:

- Cervical cancers
- Vulval and vaginal cancers
- Anal cancers
- Oropharyngeal cancers
- Genital warts

Who should get the HPV vaccine?

- Individuals aged between 9 to 45 years old
- 3 doses (injections) at 0, 2 and 6 months are required
- Vaccination does not remove the need for cervical cancer screening and women are advised to continue routine cervical cancer screening
- HPV vaccines are not routinely recommended during pregnancy

TERMS & CONDITIONS:

- Package price does not include Doctor's consultation fees
- Surcharges may be incurred for additional tests and procedures
- Surcharges may be applied during Public holidays and after office hours (Monday to Friday, 9am to 5pm)
- Packages are subject to change without prior notice
- Not valid with any other promotions
